

Bug Reports

Author: Cougar Liu<liucougar@scim-im.org>

Sourceforge [bug tracking system](#) are our primary bug management platform.

Please select appropriate category (component) and group (version), and supply as much information as possible. If you are not sure which component the bug you encounter belongs to, just select the default "none". In addition, please follow these guidelines.

Your system distribution

Please specify the exact distribution and version of your system (for example, Fedora Core 2, SUSE LINUX Enterprise Server 9, Mandrake 10.0, Debian Sarge, etc.). If you have any unofficial packages installed, it is also good to tell us. The packages especially related to SCIM includes GTK+, g++ (if you built from source), Qt and KDE (if you use skim and/or qt-imodule).

How you installed SCIM

Please tell us if you built from source or installed binary packages.

If you built SCIM from source, please tell the tarball version (or !CVS), and the command you used to install SCIM.

If you installed pre-built binary packages, please tell which packages you used, especially if they are not from this site. It would be also good to tell us the command (or actions, if you used some GUI package tool) you installed these binary packages.

Your desktop environment

If SCIM installed fine but you can't invoke it, most likely you are having something wrong with your desktop environment. Please send these information with your report: Your locale (paste the output of command `locale` is sufficient), your desktop environment (GNOME, KDE, etc.), the value of the environment variables `$XMODIFIERS` and `$GTK_MODULE`.

How you started SCIM

It is also important to tell us how you started SCIM on your system -- whether you run the commands by hand, or put them in some config file. Please tell exact what command you used, and which file you put them in.
