

scim-input-pad 0.0.2 is available for testing.

Author: James Su<james.su@gmail.com>

It's an onscreen input pad used to input some symbols very easily.

The main window is scrollable now. A keyboard data file which includes some useful KeyEvents was added.

For translators, the major improvement is intltool integration. Now all translation for group/table names can be done in po files. If you are interested in translating scim-input-pad into your native languages, please feel free to submit the translated po files to me.

You can generate the pot files by invoke command "make update-po" in scim-input-pad-0.0.2/po subdir.

Please feel free to test it and give me feedback.
