

# What does the warning "QInputContext: no input method context available" mean?

What does the warning "QInputContext: no input method context available" mean?

When you start a KDE/Qt app, if you see the following warning:

```
QInputContext: no input method context available
```

Then you must use xim as your qt immodule. However, you mis-set your XMODIFIERS variables, it should be:

```
XMODIFIERS=@im=SCIM
```

(the last four letters should be capital)
