

scim 1.3.3 is available for testing.

Author: James Su<james.su@gmail.com>

It's another beta version of the next stable branch 1.4.0.

Changes since 1.3.2:

- String configurations now could be empty. So user could disable some configurations which have default values. `--version-script` was used to restrict the exported symbols of libscim and some modules. It could fix some incompatibility issues in qt3 or gtk applications and qtimm/gtkimmodule. Some small bugfixes.

TODOs before 1.4.0:

- Update translations. More bugfixes.

Please test it as much as you can and give us feedback as soon as possible. I would release 1.4.0 before the end of this week, if no more bugs were found.
